molochnogo skotovodstva)

Orig Pub: Tr. Stavropol'skogo s.-kh. in-ta, 1956, vyp. 7, 287-
298

Abstract: The dairy cattle of Stavropol'ye were late in reach-
ing maturity and had a milk yield, which did not ex-
ceed 500-600 kg. for a lactation period of 300 days.
However, by means of various measures put into opera-
tion (mating stations, dairymen's teamwork, associa-

Abstract: tions, communal enterprises organized since 1921, utilization of the approved sires and organization of control unions, and cooperative associations for the sale of dairy products, etc.), the milk yield of the dairy cattle was increased. Milch cows with a milk yield of 3,000-4,000 kg. appeared. In 1928, the first volume of the State Herd Book on Red Steppe cattle was published. In 1935, the Mineralovodsk State Breeding Center for Red Steppe Cattle was organized. Thereafter, the performance of the breed continued to improve, the average milk yield [per lactation period] on the better farms attaining 3,000-6,000 kg. See: RZhBiol, 1957, 66565.

Title : A Method of Morphological Thrombocyte Examination.

Orig Pub : Labor. delo, 1956, No 1, 12-14.

Abstract : Two ml of a 3.8 percent sodium citrate solution, or 0.5 ml of a 1 percent heparin solution are shaken with 8 ml of blood in a test tube. The test tube is then obliquely placed into a thermostat for 4 hours. Plasma is transferred into a centrifugal test tube in which it is again placed into a thermostat at 30° C temperature for 20 hours, a leukocyte sediment forms there. The plasma is separated and centrifuged at 800/1000 revolutions per minute for 10 minutes, then poured out. The sediment is then stirred together with plasma drops which runs down the walls of the glass tube. Smears are prepared from

"Problems in the Diagnosis of Hemolytic Anemias," by Yu. I. Loriye, M. A. Umnova, and L. I. Mikhaylova, Central Order of Lenin Institute of Hematology and Blood Transfusion (director, Prof A. A. Bagdasarov, Corresponding Member, Academy of Medical Sciences USSR), Ministry of Health USSR, Problemy Gematologii i Perelivaniya Krovi, Vol 1, No 6, Nov/Dec 56, pp 13-18

Observations were made on 32 patients suffering from various forms of chronic hemolytic anemia. Results of these studies proved that:

1. In patients with acquired hemolytic anemia, it is possible to detect antibodies that are fixed to erythrocytes as well as free ones. In certain cases the antibodies succeed in separating from the erythrocytes of the patient but again are fixed onto normal erythrocytes.

SUM. I287

2. There is a certain parallelism between the severity of the hemolytic process and the intensity of Comb's reaction.

3. Antibodies are not the only factor effecting the development of hemolysis, but in acquired hemolytic anemia, antibodies may have a specific nature.

4. The detection of immunological factors in the pathogenesis of acquired hemolytic anemia opens another path for its therapy.

5. It is necessary to run additional tests for selecting compatible blood for blood transfusion to patients suffering from acquired hemolytic anemia.

Loriye, Central Order of Lenin Institute of Hematology and
Blood Transfusion, Moscow, Zdravookhraneniye Kazakhstana,
No 3, 1957, pp 3-10

The Central Order of Lenin Institute of Hematology and Blood Transfusion defines leukosis and reviews means for its therapy. This institute also touches upon effects of ionizing radiation and summarizes blood preservatives and blood substitutes.

Among therapeutic agents mentioned are "dopan," a uracil derivative, 6-mercapto-purine, fresh plasma in combination with vitamin B complex, leukocyte mass, iron-ascorbic acid and "ferkoven," ACTH and cortisone, Vitamin B₁₂, antihemolytic globulin, and thrombocyte mass.

Some of the blood preservatives mentioned are glucose-citrate, saccharose-citrate, anticytolysing substances of Soviet preparation such as diprozin, ethizin, and aminazin, ion-exchange adsorbents, chemical stabilizers, and quick cooling and freezing methods.

Blood substitutes, besides whole blood, include heterogenous blood, and synthetic blood substitutes such as the Therapeutic Serum of Belen'kiy, BK-8, colloidal infusions, and protein hydrolysates. Other blood substitutes mentioned are the dextren type of preparation (polyglyukin, sinkol, macrodex, and intradex), and periston (polyvinylpyrrolidone). (U)

TITLE: Toward an Abundance of Potatoes

PERIODICAL: Nauka i zhizn', 1959, Nr 7, pp 17-22 (USSR)

ABSTRACT: The article is concerned with the growing of potatoes in the USSR, their manuring and fertilizing, top-dressing, tilling, pest control, and the development of special machinery for their cultivation. The following organizations and personalities are mentioned: Vsesoyuznyy nauchno-issledovatel'skiy institut spiritovoy promyshlennosti (All-Union Scientific Research Institute of the Alcohol-Producing Industry), Smolenskaya opytnaya stantsiya (Smolensk Testing Station), Institut kartofel'nogo khozyaystva (Institute of Potato Growing), Petrovskaya gosudarstvennaya selektsionnaya stantsiya (Petrovskaya State Selection Station), Iglinskaya and

Toward an Abundance of Potatoes

Surazhskaya RTS (Iglino and Surazh RTS), Karachevskaya MTS (Karachevo MTS), and Academician T.D. Lysenko. In 1958, the Ministerstvo sel'skogo khozyaystva SSSR (Ministry of Agriculture of the USSR) organized a contest to help develop new machinery for the mechanization of unwieldy operations in potato and vegetable cultivation. In the Moskovskaya, Leningradskaya, Sverdlovskaya, Gor'kovskaya, Kemerovskaya, Rostovskaya, and other oblasts, special kolkhozes to supply large cities and industrial centers with potatoes, vegetables, fruit, and berries will be established. There is 1 set of pictures and 5 photographs.

AUTHOR: Lorkh, G.G., Engineer 99-8-2/12

TITLE: Establishment of Irrigation Fields by Means of Waste Water from Moscow (Ob organizatsii poley orosheniya na baze stochnykh vod Moskvyy)

PERIODICAL: "Gidrotekhnika i Melioratsiya", 1957, Nr 8, pp 8-11 (USSR)

ABSTRACT: Sewage of the city of Moskva and the adjacent industrial areas is presently conducted into the Moskva river, the Klyaz'ma river and its tributaries. This waste water could be used to irrigate approximately 220,000 hectares, east of Moskva. In order to realize this project, 2 main sewage pipe lines totaling 1010 km in length, and 245 km of distribution lines, have to be installed. The total cost of sewage lines and irrigation structures would amount to 1985 million Rubles. Besides considerable increase of various field crops, the advantages of such a system would be: less expenses for the building and operation of new sewage purification stations and improved sanitation. The article contains 1 figure (map).
